Metakaolin-based geopolymer refers to a type of geopolymer composite material primarily composed of metakaolin, which is a thermally activated form of kaolinite clay. Geopolymers are inorganic aluminosilicate materials formed through the polymeric network structure created by the reaction between aluminosilicate precursors and alkaline activators. Metakaolin, derived from the calcination of kaolinite clay at high temperatures, serves as a key precursor in the formation of geopolymer matrices, offering enhanced mechanical properties, durability, and environmental sustainability compared to traditional cementitious materials.

The global Metakaolin-Based Geopolymer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
