Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Metal Alloy Type Electromagnetic Shielding Film market.

When electronic components are working, components such as capacitors form electric fields, and components such as inductors form magnetic fields, which will excite electromagnetic waves, and useless electromagnetic waves will be induced with the electrical signals of the components themselves or other electronic components. Therefore, in order to avoid signal The signal is distorted due to electromagnetic interference during the transmission process. After pressing the cover film, the FPC will press a layer of electromagnetic shielding film to shield the external electromagnetic

interference, thereby ensuring the normal operation of the FPC circuit.

At present, the electromagnetic shielding film can be divided into three types: metal alloy type electromagnetic shielding film, conductive adhesive type electromagnetic shielding film and microneedle type electromagnetic shielding film. Among them, the metal alloy type electronic shielding film realizes the shielding effect by the metal alloy layer, and the performance of the metal alloy type electromagnetic shielding film product is improved by thickening the metal layer, using conductive particles with better diameter and size consistency, and improving the glue formula. The mainstream electromagnetic shielding film.

**Metal alloy type electromagnetic shielding film structure:** the upper layer of the insulating layer is a metal alloy layer (mainly copper, silver), and the upper layer of the metal alloy layer is a conductive adhesive layer (containing conductive particles, which is relatively thin). **Features:** lower production cost, higher shielding effectiveness.
