The global Metal Based Diamond Composite Materials market size is predicted to grow from US\$ 208 million in 2025 to US\$ 416 million in 2032; it is expected to grow at a CAGR of 10.6% from 2026 to 2032.

Metal based diamond composite materials have been widely used in the electronic industry and mechanical manufacturing industry due to their superior physical and mechanical properties. However, the improvement of composite material performance is limited by traditional manufacturing techniques. Additive manufacturing provides ideas for the preparation of complex structured metal based diamond composite materials. Additive manufacturing (3D printing) is a near net forming technology that transforms digital models into physical entities, with the advantage of designing and manufacturing personalized customized materials with complex structures and small anomalies. The application of 3D printing technology in manufacturing metal based diamond composite materials with better and more stable performance, while controlling production costs and reducing energy consumption, has become an inevitable trend in China's industrial development.

In today's era of rapid technological development, the demand for thermal management materials is increasing, especially in fields such as electronic packaging and high-power devices. Metal based diamond reinforced composite materials have become a new star in this field due to their unique properties. Copper diamond is a composite material of diamond powder and copper alloy. High quality artificially synthesized diamond powder is used, which has a thermal conductivity of around 600W/M.K and an extremely low coefficient of thermal expansion. Under appropriate processes, diamond particles can form metallurgical bonding interfaces with copper alloys, resulting in copper diamond composite materials with excellent thermal conductivity and suitable coefficient of

thermal expansion. Aluminum diamond is a composite material composed of aluminum and diamond, which is an excellent material with low thermal expansion, high thermal conductivity, high strength, and lightweight. This product has received high attention as a heat dissipation component for GaN semiconductor chips. Silver diamond composite materials have excellent thermal conductivity of up to 650W/mK at room temperature, and their CTE is close to that of semiconductor materials, significantly higher than the thermal conductivity of traditional packaging materials such as CuW.
