The global Metal Bioleaching market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Metal bioleaching is a biotechnological process that uses microorganisms to extract valuable metals from ores and concentrates. This method leverages the natural metabolic activities of specific bacteria and archaea, which oxidize metal sulfides or other mineral compounds to release metals in a soluble form. Commonly used microorganisms include *Acidithiobacillus ferrooxidans* and *Leptospirillum ferrooxidans*. Metal bioleaching is advantageous due to its lower environmental impact compared to traditional pyrometallurgical methods, offering a more sustainable approach to mining and recycling. It is widely applied in the mining industry to recover metals such as copper, gold, and zinc from low-grade ores and tailings.

United States market for Metal Bioleaching is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
