The global Metal Dryer market size is predicted to grow from US\$ 1773 million in 2025 to US\$ 2777 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

A metal dryer is a device used to remove moisture from metal products, parts or materials. Metal may be exposed to moisture during manufacturing, processing, transportation, etc. The presence of moisture may cause metal corrosion, deformation or affect the performance of the product. The metal dryer evaporates the water in the metal material by controlling parameters such as temperature, humidity and ventilation, so as to achieve the purpose of drying. In the future, the metal dryer may be more intelligent, using an automatic control system to achieve precise control of parameters such as temperature and humidity. Intelligent control can improve production efficiency and reduce manual intervention.
