Abstracts

The global Metal Electromagnetic Induction Heater market size is predicted to grow from US$ 1636 million in 2025 to US$ 2118 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

A metal electromagnetic induction heater is an electrical heating system that uses alternating magnetic fields (produced by an AC-driven coil/inverter) to induce eddy currents and localized resistive heating inside conductive metal workpieces — enabling contactless, fast, controllable heating for processes such as hardening, brazing, annealing, melting and preheating.

Upstream suppliers supply raw components — power electronics (IGBTs/SiC MOSFETs), magnetic materials, copper conductors, cooling systems and control software; midstream manufacturers integrate these into induction power units, coils/inductors, converters and complete systems (including automation and service contracts), while OEMs, systems integrators and selected aftermarket/service providers install and maintain plants and furnaces for downstream end customers in automotive, foundry, aerospace and contract heat-treating; value flows from raw-materials and semiconductors to specialized coil design and service agreements, and competitiveness depends on energy efficiency, coil/fixture IP, local service footprint and regulatory/energy-efficiency drivers.

2024 Global Market Volume (units, estimated): 291,000 units. Average Global Market Price (per unit, estimated): USD 5,500 / unit. Market Average Gross Profit Margin: 30%–35%.
