A metal film analog potentiometer is a type of electronic component. It is composed of a resistive element made of metal film, which is deposited on an insulating substrate. The potentiometer has three terminals: two fixed - end terminals and one movable terminal (wiper). By rotating or sliding the movable terminal along the resistive element, the resistance ratio between the fixed - end terminals and the movable terminal can be continuously changed. This allows it to function as a voltage divider, providing a continuously variable output voltage that is proportional to the position of the movable terminal. Metal film analog potentiometers are widely used in various electronic circuits for applications such as volume control in audio equipment, brightness adjustment in displays, and parameter tuning in measurement and control systems due to their relatively stable performance, good linearity, and long - term reliability.

United States market for Metal Film Analog Potentiometers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Metal Film Analog Potentiometers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
