The metal film mirror is an optical element that uses a metal film as a reflection medium. Through the excellent reflection performance of the metal film, light reflection and focusing are realized.

The metal film mirror usually consists of a base material and a metal film. The metal film is deposited on the surface of the base material to form a flat and smooth reflective surface. When the light is irradiated on the metal film, the free electrons of the metal film interact with the light, and electromagnetic oscillation occurs, by producing a reflection effect. The metal film mirror is high reflectivity, broadband operation, durability, adjustability, and has wide applications.
