The global Metal Injection Molding (MIM) market size is predicted to grow from US\$ 4724 million in 2025 to US\$ 8873 million in 2031; it is expected to grow at a CAGR of 11.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Metal Injection Molding (MIM) is an advanced manufacturing process that combines the versatility of plastic injection molding with the strength and integrity of metal to produce complex, high-performance metal parts. The process involves mixing fine metal powders with a thermoplastic binder to form a feedstock that can be injected into molds in the same way as plastic. After molding, the binder is removed through a process called debinding, and the part is then sintered at high temperatures to densify the metal structure. The result is a net-shape or near-net-shape component with mechanical properties comparable to wrought metal.

MIM is particularly suitable for producing small, intricate components that would be costly or impractical to make through traditional metalworking methods such as machining, casting, or forging. It offers advantages like high precision, excellent surface finish, and the ability to produce complex geometries in high volumes with minimal material waste. Typical materials used in MIM include stainless steels, tool steels, titanium alloys, cobalt-chromium, and various specialty metals. Due to these benefits, MIM is widely used in industries such as medical devices, automotive, aerospace, consumer electronics, defense, and industrial tools.

The advantages of the metal injection molding process lie in its capability to produce mechanical properties nearly equivalent to wrought materials, while being a net-shape process technology with good dimensional tolerance control. Metal injection molded parts offer a nearly unlimited shape and geometric-feature capability, with high production rates possible through the use of multi-cavity tooling.

Geographically, Asia-Pacific is the dominant region in the MIM market, with China, Japan, and South Korea leading in terms of manufacturing capabilities and volume production. North America and Europe also maintain significant market shares, particularly in high-value sectors like medical, aerospace, and defense. The proliferation of additive manufacturing (3D printing) technologies has sparked debate over competition with MIM; however, MIM remains more cost-effective for mass production of small, precision components. Innovations such as micro-MIM and the integration of titanium and ceramic MIM are expanding the scope of applications and pushing the boundaries of the technology.

Global top manufacturers of Metal Injection Molding (MIM) include Indo-Mim, OptiMIM (Form Technologies), ARC Group, Ecrimesa Group, Smith Metal Products, Netshape Technologies (MPP) and Uneec, etc. Indo-Mim, as the largest player, makes up about 5%. China is the largest producer of metal injection molding, with a production market share over 50%. And China also holds the highest revenue market share over 40%. Major product types of MIM include stainless steel, iron powder, magnetic alloys and copper, etc. Stainless steel is the largest segment, with a share nearly 60%. MIM is widely used in electronic, automotive, industrial components, medical & dental and firearms, etc. The largest segment is electronic, with a share over 40%.
