Metal ion extractants are mainly seven common hydrogen ions or radicals such as phosphoric acid, salt, and benzene, which are replaced by some long-chain alkyl groups. When metals combine with these extractants, they turn into metal-organic compounds and dissolve in organic solvents. Due to the different binding abilities of various metals to these extractants, the order in which these extractants extract metals is different, thereby separating these metal ions. Transfer to another solvent.

The global Metal Ion Extractant market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
