Abstracts

According to this study, the global Metal Membrane Ammonia Cracker market size will reach US$ 651 million by 2031.

Metal Membrane Ammonia Cracker is an advanced hydrogen production system that integrates ammonia decomposition with metal membrane-based hydrogen purification. In this system, ammonia (NH?) is thermally cracked into nitrogen (N?) and hydrogen (H?) at elevated temperatures (typically 500–800°C), and the produced hydrogen is selectively separated and purified through a dense metal membrane—commonly composed of palladium or its alloys. This integration significantly enhances hydrogen purity (up to 99.999%) and simplifies downstream processing.
