The global Metal Oxide Aerogel market size is predicted to grow from US\$ 384 million in 2025 to US\$ 789 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

Metal Oxide Aerogel refers to a class of highly porous, ultra-lightweight solid materials composed of metal oxide networks (such as alumina, titania, zirconia, or iron oxide) formed through sol-gel processing followed by supercritical or ambient drying, resulting in extremely high surface area, low density, and excellent thermal stability compared with silica aerogels. The supply chain begins upstream with raw materials including metal alkoxides or inorganic salts (e.g., aluminum isopropoxide, titanium tetrachloride), solvents (alcohols), catalysts (acids/bases), and surface modifiers; the midstream involves sol-gel synthesis, aging, solvent exchange, and drying (supercritical CO₂ or ambient pressure drying), often followed by heat treatment or functionalization to tailor pore structure and mechanical strength; downstream, the aerogels are processed into powders, monoliths, or composite forms for integration into applications such as high-temperature insulation, catalysts and catalyst supports, energy storage electrodes, environmental remediation, and aerospace or defense thermal protection systems. In 2025, global Metal Oxide Aerogel output was about 20,000 tons with 26,000 tons of capacity, average prices of USD 15,000-40,000 per ton, and gross margins around 37%.
