The global Metal Planer market size is predicted to grow from US\$ 1908 million in 2025 to US\$ 3045 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

In 2025, global metal planer production reached approximately 135,000 units. A metal planer is a type of machine tool used for machining metal surfaces. It removes material by moving a cutting tool (planer blade) in a linear reciprocating motion across the workpiece, enabling the production of flat surfaces, steps, slots, grooves, and other shapes. Planers are suitable for processing small, medium, and large workpieces and are widely used in precision assembly and finishing operations. Depending on structure and application, metal planers can be classified into types such as fixed planers, gantry planers, table planers, and manual planers.

As the manufacturing industry advances toward higher precision, automation, and diversification, the metal planer market is maintaining steady growth. The increasing demand for flat surface machining, slotting, and large workpiece finishing in sectors such as mechanical processing, mold manufacturing, heavy equipment refurbishment, and steel metallurgy has driven the adoption of planer machines. At the same time, with the widespread application of industrial automation and CNC technology, traditional manual planers are gradually being replaced by high-efficiency, intelligent planers, particularly in medium to large enterprises and precision manufacturing. The Asia-Pacific region, with its large manufacturing base and active infrastructure investment, has become the primary driver of market growth, while Europe and North America exhibit strong demand for high-precision and highly reliable equipment. In the coming years, with the promotion of smart manufacturing, green processing, and high-capacity machinery, the metal planer market is expected to continue its stable growth and trend toward automation, flexibility, and digitalization.
