Metal powder atomization is a process used to produce fine metal powders with specific characteristics, there are many methods to produce metal powders from valuable metals and alloys such as titanium, aluminium, stainless steel, iron, copper, nickel-based alloys and cobalt-based alloys. Atomization is generally viewed as the method of choice due to the geometrical properties of the powder particles that can be achieved. This makes it ideal for additive manufacturing (AM). In the atomization process, the melted metal alloys are first refined and degassed, then poured into a gas nozzle, where the liquid material is disintegrated into metal powder by a high-pressure gas stream. Gas atomization, water atomization and direct reduction all rely on industrial gases and gas technologies. Gas atomization requires argon and nitrogen, whereas a hydrogen atmosphere is needed for water atomization followed by oxide reduction.

The global Metal Powder Atomization Plant market size is projected to grow from US\$ 294 million in 2024 to US\$ 578 million in 2030; it is expected to grow at a CAGR of 11.9% from 2024 to 2030.
