The global Metal Powder Gas Atomizer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Metal powder atomization is a process used to produce fine metal powders with specific characteristics, there are many methods to produce metal powders from valuable metals and alloys such as titanium, aluminium, stainless steel, iron, copper, nickel-based alloys and cobalt-based alloys. Atomization is generally viewed as the method of choice due to the geometrical properties of the powder particles that can be achieved. This makes it ideal for additive manufacturing (AM). In the atomization process, the melted metal alloys are first refined and degassed, then poured into a gas nozzle, where the liquid material is disintegrated into metal powder by a high-pressure gas stream. Gas atomization, water atomization and direct reduction all rely on industrial gases and gas technologies. Gas atomization requires argon and nitrogen, whereas a hydrogen atmosphere is needed for water atomization followed by oxide reduction.

United States market for Metal Powder Gas Atomizer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
