The global Metal Powder Injection Molding Parts market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Metal Powder Injection Molding (MIM) is a process that combines the flexibility of plastic injection molding with the mechanical and thermal properties of metal. It involves mixing finely powdered metal with a binder material to create a ?feedstock? that is then shaped and solidified using injection molding. The process is particularly suited for producing small, complex-shaped metal components with outstanding mechanical properties. After molding, the parts undergo debinding and sintering to remove the binder and densify the powders, resulting in high-density, net-shaped components.

United States market for Metal Powder Injection Molding Parts is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
