Abstracts

The global Metal Slider Coupling market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The metal slider coupling consists of two half-couplings with radial grooves on the end faces and an intermediate slider (or intermediate disk) with convex teeth (or tenons) on both sides. The slider is usually annular and made of metal materials such as steel or wear-resistant alloy. The convex teeth (tenons) of the intermediate slider are embedded in the grooves of the two half-couplings to form a moving pair. When there is relative displacement between the two shafts, the intermediate slider can slide in the groove to compensate for the relative displacement between the two shafts during installation and operation.

In recent years, with the development of the machinery industry towards mechatronics, downstream users have put forward higher requirements for the technology and performance of couplings. High speed, heavy load, high precision, stable operation, high transmission efficiency and simple maintenance are the couplings. The technical development direction of the device, its technological innovation is mainly reflected in the optimization and improvement of the production process, process, and product structure. As a transmission connector, industrial couplings are mainly used in major equipment sets such as metallurgical equipment and mining machinery. The development of the industry is affected by the development scale and trend of downstream industries.
