The global Metal Spinning Parts market size is predicted to grow from US\$ 2817 million in 2025 to US\$ 3792 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

In 2025, the global production of spun metal parts reached 76.7386 million pieces, with an average selling price of US\$37.53 per piece.

Spun metal parts are axisymmetric or near-axisymmetric metal components manufactured using a metal spinning process. They typically use metal blanks, discs, tube blanks, or preforms made from materials such as aluminum, carbon steel, stainless steel, copper, brass, titanium alloys, and nickel-based alloys. Using manual spinning, automatic spinning, CNC spinning, hot spinning, shear spinning, or related rotational forming equipment, the material is gradually plastically flowed and conformed to the target shape through a mandrel, spinning wheel, tail jack, and localized pressure. Typical product forms include cones, hemispheres, tank heads, cylinders, covers, reflectors, nozzles, fan inlets, lampshades, cup-shaped parts, housings, transition parts, and special thin-walled structural parts.

From a product roadmap perspective, CNC spinning and automated spinning are improving the repeatability, batch stability, and material utilization of the traditional manual spinning industry. For low-volume and complex curved surface parts, manual experience remains important; for medium-volume, high-consistency parts, or automotive/HVAC/industrial OEM parts, CNC spinning and automated spinning are the preferred options; for aerospace, defense, and high-end energy scenarios, hot spinning, titanium alloy spinning, high-temperature alloy spinning, and the integrated capabilities of post-spinning welding, heat treatment, machining, and surface treatment are more critical. The main upgrade direction for the industry in the future is not simply expanding production capacity, but improving digital programming, automated equipment, quality

traceability, material databases, and multi-process combination capabilities. In terms of production capacity, major global production is concentrated in North America, Europe, and East Asia, with a single production line capacity of approximately 1.5-1.8 million units per year. The industry average capacity utilization rate is about 83.73%, and the gross profit margin reaches 29.37%.
