Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Metal Tableware category encompasses everything from aluminum dinner plates to stainless steel serving platters.

The two main materials used to create metal dinnerware are aluminum and stainless steel. These materials resist corrosion, which is vital in a metal piece that'll likely be submerged frequently during cleaning and will host acidic liquids, such as tomato sauce. Aluminum typically is less expensive than stainless steel but isn't as durable when subjected to the dropping and banging of a high-volume foodservice establishment. Stainless steel is a stronger material but will cost operators more than aluminum.
