## Abstracts

The global Metal Unibody Cold Plate market size is predicted to grow from US\$ 15.65 million in 2025 to US\$ 81.39 million in 2032; it is expected to grow at a CAGR of 27.1% from 2026 to 2032.

The integrated metal cold plate is a thermal management solution specifically designed for high-performance servers. It is made of high thermal conductivity metals such as copper or aluminum and features internal cooling channels. By circulating coolant in direct contact with core server components, the cold plate effectively transfers and dissipates heat, ensuring stable operation under high workloads. Its integrated design simplifies installation and reduces the risk of leakage. Widely used in data centers, cloud computing, and high-performance computing (HPC) environments, it significantly enhances overall cooling efficiency and system reliability.

Metal unibody cold plates are gaining traction as a critical thermal management solution for high-power electronic systems due to their superior thermal conductivity, mechanical strength, and reliability. Compared to traditional welded or assembled designs, unibody structures offer reduced thermal resistance, improved heat uniformity, and lower leakage risk in liquid cooling systems. These cold plates are widely used in data center servers, energy storage systems, EV power modules, and high-performance industrial equipment. China, the United States, and Germany represent the largest consumer markets, supported respectively by data center expansion, electric vehicle growth, and advanced industrial automation. With the continuous evolution of compute-intensive systems and power electronics, the metal unibody cold plate market is expected to expand steadily.
