Metalens is a lens developed based on metasurface technology and using micro-nano technology and dielectric materials. Metalenses will completely subvert the cumbersome lens groups in traditional optical devices, realize the original lens functions of several millimeters or even centimeters with a thickness of microns, and integrate the functions of multiple optical elements into one, greatly reducing the size and weight of the imaging system. , simplifying the structure and optimizing performance.

The commercialization of metalens is in the preliminary development stage. Currently, it is mainly customized designs and there are no universal mass-produced products. But as the technology evolves, metalens will become a key enabler of the next generation of compact imaging, sensing and display applications. Major head manufacturers have begun to accelerate the layout of metalenses, and metalenses are about to usher in in-depth applications in various fields and full mass production.
