A metalens is a type of lens made from nanostructures rather than traditional glass or plastic. These nanostructures are designed to manipulate light at the nanoscale, allowing for the creation of lenses that are much thinner and lighter than traditional lenses. Metalenses have the potential to revolutionize a wide range of optical technologies, including cameras, microscopes, and virtual reality devices.

The commercialization of metalenses are still in its early stages of development. Currently, it is mainly customized in design and manufacturing, and there are only a few general mass-produced products. But as the technology evolves, metalenses will become a critical enabler for the next generation of compact imaging, sensing and display applications. Major leading manufacturers have begun to accelerate the layout of metalenses, and metalenses are about to usher in in-depth applications and full mass production in various fields.

United States market for Metalenses is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Metalenses is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
