Metalized mulch film is a type of agricultural film used in farming to improve crop growth and yield. It is made by coating a plastic mulch film, usually polyethylene, with a thin layer of metal, often aluminum. The metalized layer gives the film its reflective properties, which have several benefits for crop production. The reflective surface of the metalized mulch film reduces the amount of light reaching the soil, inhibiting weed growth. The reflective surface can repel certain insects and pests by confusing them or disrupting their normal behavior patterns.
