## Abstracts

The global Metallic Self-lubricated Bearing market size is predicted to grow from US\$ 5944 million in 2025 to US\$ 9122 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Metallic Self-lubricated Bearing is a metal self-lubricating bearing that can operate without an external lubricant. It usually consists of a metal matrix and a lubricating layer, which usually consists of solid lubricants (such as graphite, PTFE, etc.) and metal powders (such as copper, lead, etc.).

Since self-lubricating bearings do not require external lubricants and have the advantages of energy saving and environmental protection, Metallic Self-lubricated Bearing has a promising application prospect in terms of environmental protection technology and sustainable development. It is expected that in the next few years, this kind of bearing will be more widely used in new energy, green transportation and other fields.
