Offered in high glossy metallic film of aluminium foil, the metallized films are coated with a thin layer of aluminium wire and are high in demand in the food and beverages sector pertaining to their cost- effective solution. These films help in reducing weight and cost of the material and are being utilized for wrapping films, labelling films, peelable and non-peelable lidding films. Metallization is performed through a physical vapour deposition process. Therefore, these films have a super reflective silvery surface and are being considered as highly combustible. Moreover, as these films are opaque, they don't allow the light to travel inside and are good for protecting light-sensitive products. Also, being cost-effective, they come with great barrier properties. One of the major advantages of the metallized nylon film is that they are puncture resistant, meaning extreme damage to the product won't take place. The aluminium remains flat and smooth which doesn't delaminate or curl and the metal doesn't flake off. Therefore, these metallized nylon films are the top choice of the customers these days.
