Metallurgical silicon carbide is a refractory material used in the metallurgical industry. It is usually made of high-purity silicon carbide (SiC) material, which has excellent high temperature stability, corrosion resistance and mechanical strength. In the metallurgical industry, metallurgical silicon carbide is usually used in the furnace wall, furnace bottom, furnace cover and other parts in the process of high temperature smelting and refining

to withstand high temperature and corrosion. The high-temperature stability and corrosion resistance of metallurgical silicon carbide enable it to withstand chemical reactions at high temperatures and the erosion of metal liquids, thereby ensuring the stability and efficiency of the smelting and refining process. There are various methods for preparing metallurgical silicon carbide, including hot pressing, chemical vapor deposition, and reaction sintering. Among them, the hot pressing method is a commonly used preparation method, and its basic steps include: first, mix the silicon carbide powder and other additives uniformly; then, place the mixture under high temperature and high pressure for hot pressing; finally, the formed parts carry out sintering treatment to obtain metallurgical silicon carbide material. Due to its excellent high-temperature stability and corrosion resistance, metallurgical silicon carbide has been widely used in the metallurgical industry, such as for the manufacture of high-temperature furnaces, casting molds, refractory materials, etc.
