Melanoma is one of the serious types of skin cancers that develops from pigment-containing cells called as melanocytes. Melanomas typically occur in the skin, but may rarely occur in the mouth, intestines, or eye. In women, they most commonly occur on the legs, while in men they are most common on the back. Moles, brown spots and growths on the skin are found to be the symptoms associated with the disease. When it spreads to other places in body, it's called metastatic, or advanced. Although in many cases metastatic melanoma can't be cured, treatments and support can help people live longer and better. Doctors have therapies that have greatly increased survival rates. And researchers are working to find new medications that can do even more.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs.
