Metasurface spectrometer is a miniature spectrometer that utilizes the modulation of light by ultra-surface arrays to realize spectroscopy. Ultra-surface technology, combined with computational reconstruction algorithms, allows more spectral information to be sampled with fewer broadband filters, which results in a system with higher signal-to-noise ratio and resolution. Compared with the traditional spectrometer, the metasurface spectrometer has the advantages of very small size, very low cost, small inter-stage difference, etc., which can be widely used in the field of cell phone, environmental protection, robot sensing, etc..
