The global Methacrylic Anhydride (MAAH) market size is predicted to grow from US\$ 48.74 million in 2025 to US\$ 62.62 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

Global sales of Methacrylic Anhydride (MAAH) was about 6030 tons in 2025 with average price of 8263 USD/ton. The average gross margin of the industry is between 20%-25%.

Methacrylic Anhydride (MAAH), also known as methacrylic acid anhydride, is a reactive unsaturated carboxylic acid anhydride used as a methacryloylating reagent, reactive monomer, and synthetic intermediate in polymer/material chemistry. It is commonly supplied as a stabilized liquid because of its high reactivity and sensitivity to heat/moisture.

Market Drivers: Demand for Methacrylic Anhydride (MAAH) is fundamentally driven by the need for methacrylation / methacryloylation modification across downstream applications. The demand base is supported by two major segments: (1) traditional materials applications (e.g., light-curable coatings, crosslinked resins, and resin/fiber intermediates), and (2) functional and biomaterials applications (e.g., introducing polymerizable double bonds into gelatin, hyaluronic acid, polysaccharides, and other substrates to prepare photocrosslinkable hydrogels and bio-ink precursors). This gives MAAH a dual demand profile, supported by both conventional industrial materials and emerging advanced biomaterials.

Market Challenges: The key challenge for MAAH is not only price, but also handling difficulty caused by its high reactivity. In commercial practice, it is often supplied in a

stabilized form (with polymerization inhibitors), and it is sensitive to moisture, heat, and storage conditions, which increases requirements for transportation, warehousing, regulatory compliance, and on-site handling by users. In downstream modification reactions, process outcomes are also highly sensitive to variables such as pH control, dosing rate, mixing/dispersion conditions, and post-reaction purification, all of which can affect substitution consistency and final material performance. For higher-end materials and biomaterials customers, batch-to-batch consistency and impurity control further raise supplier qualification barriers.

Development Trends: The market is gradually shifting from a 'supply availability' focus toward better controllability, safer handling, greener processing, and application-specific customization. On the technical side, process development is moving toward greener and more controllable approaches (such as aqueous systems, reduced reagent usage, and tighter control of the degree of methacrylation) to better match end-use performance requirements. In addition, continuous-flow chemistry is increasingly being explored for the preparation of methacrylated biomaterials (e.g., GelMA), highlighting advantages in safety, scalability, and batch consistency when using highly reactive reagents such as MAAH. Commercially, future competitive suppliers are likely to be those that provide not only MAAH itself, but also a more complete solution package including stabilized grades, inhibitor/purity control, application support, and consistency assurance.
