Methane fermentation is a versatile biotechnology capable of converting almost all types of polymeric materials to methane and carbon dioxide under anaerobic conditions. Methane fermentation offers an effective means of pollution reduction, superior to that achieved via conventional aerobic processes. The installation of this system will greatly reduce pollution and save energy. The methane fertilization system is mainly concentrated in Japan. It is widely used in agriculture, industry and domestic waste treatment.

The global Methane Fermentation System market size is projected to grow from US\$ 2514 million in 2024 to US\$ 3703 million in 2030; it is expected to grow at a CAGR of 6.7% from 2024 to 2030.
