Methane infrared sensor is a sensor used to detect the concentration of methane gas. It works based on the principle of infrared absorption, using the characteristics of methane gas to absorb infrared light of a specific wavelength, and determining the concentration level of methane gas in the environment by measuring the intensity change of the absorbed infrared light. Methane infrared sensors usually consist of a light source, a detector and an electronic signal processor. They can quickly and accurately detect the presence of methane gas and output corresponding electrical signals or digital signals. This kind of sensor has a wide range of applications in industrial safety monitoring, fire alarm systems, natural gas detection, environmental monitoring and other fields.

The global Methane Infrared Sensor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
