Methane mitigating feed additives are substances added to livestock diets to reduce the production of methane—a potent greenhouse gas—during the digestive process, particularly in ruminant animals like cows. These additives work by inhibiting the activity of methanogenic microbes in the animal's rumen or by altering fermentation pathways to produce less methane. Common examples include 3-NOP (3-nitrooxypropanol), essential oils, tannins, seaweed (like Asparagopsis), and certain probiotics. By lowering methane emissions, these feed additives help improve environmental sustainability in agriculture while often enhancing feed efficiency and animal productivity.

United States market for Methane Mitigating Feed Additives is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
