The global Methanol-fueled Ships market size is predicted to grow from US\$ 320 million in 2025 to US\$ 556 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

In 2025, global Methanol-fueled Ship approximately 89 units, with an average global market price of around US\$ 3.67 m per unit. Gross margin is about 44%. The cost is 2.06 m usd. The Production is about 200 units. Methanol-fueled ships are vessels that utilize methanol as their primary fuel source for propulsion. Methanol, also known as methyl alcohol, is a clear, colorless liquid that can be produced from natural gas, coal, biomass, or renewable sources like municipal waste.

1. Methanol as a transitional mainstream marine fuel

Before ammonia and hydrogen reach full commercialization, methanol?being liquid at ambient conditions and easier to store and retrofit?will become one of the earliest widely adopted low-carbon marine fuels, particularly for container ships and bulk carriers.

2. Rapid development of green methanol supply chains

Renewable hydrogen and biomass-based methanol projects are expanding, while ports are building bunkering infrastructure, creating an integrated fuel production-to-ship supply network.

3. Adoption of dual-fuel engines and fuel-ready designs

Newbuild vessels will increasingly use methanol dual-fuel engines and maintain conversion flexibility for future fuels, ensuring long-term regulatory compliance.

4. Emission regulations driving adoption

Stricter carbon intensity regulations and potential carbon pricing mechanisms will push shipowners toward green methanol to reduce lifecycle emissions.

5. Standardization and safety framework maturation

Due to methanol's toxicity and low flash point, classification societies and regulators are developing standardized safety, storage, and bunkering procedures, enabling broader deployment.
