As one of the important paths in the low-carbon transformation of heavy trucks, methanol heavy trucks have unique advantages in diversified technical routes. From an environmental protection perspective, methanol, as a low-carbon, oxygen-containing fuel, has the characteristics of efficient combustion, clean emissions, and renewable energy. It is recognized globally as an ideal new clean renewable energy source. It is liquid under normal temperature and pressure and is safe to use and store. The transportation is convenient. Compared with fuel vehicles, methanol heavy trucks have better emission and carbon reduction effects; from the perspective of operating costs, compared with fuels with large price fluctuations such as natural gas, methanol prices are stable and low. At the same time, methanol fuel has a higher octane number, which can improve the compression ratio and thermal efficiency of the engine, allowing the vehicle to take into account both power and fuel economy, and has obvious operating cost advantages. Not only that, the refueling speed of methanol fuel is equivalent to that of fuel, and it has ultra-long driving range and stronger adaptability to traffic scenes. It can effectively make up for the shortcomings of electric heavy trucks such as slow refueling speed and short driving range.

The global Methanol Heavy Trucks market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
