The global Methionine market size is predicted to grow from US\$ 6214 million in 2025 to US\$ 7958 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Methionine is a protein-based amino acid and lipotropic compound that helps with metabolism and breaks down fat. It contains an α -amino group, an α -carboxylic acid group and an S-methyl thioether side chain. Methionine is classed as an essential amino acid and cannot be synthesized by the body itself. In 2025, global Methionine production reached approximately 215.76 K MT. The upstream of the methionine industry is primarily based on petrochemical and sulfur chemical chains. Key raw materials include propylene, methanethiol, hydrogen cyanide, methanol, sulfur, and ammonia. These materials are mainly derived from oil refining and natural gas processing. Raw material costs typically account for 60-70% of total production cost, making methionine prices sensitive to crude oil and natural gas fluctuations. The downstream sector is heavily concentrated in animal feed applications. Methionine is an essential amino acid added to poultry, swine, and aquaculture feed to improve feed conversion efficiency and growth performance.

Methionine is one of the most essential functional amino acids in the global feed industry, with approximately 90% of demand derived from poultry and swine feed applications. The industry is capital-intensive and highly concentrated. Production is largely based on petrochemical raw materials, making cost structures sensitive to oil and natural gas prices. Asia-Pacific represents the largest consumption region, with China playing a critical role in both production and demand. Over the next five years, the global methionine market is driven by aquaculture expansion, precision feed formulation, and rising protein consumption in emerging economies.
