The global Methyl Rosmarinate market size is predicted to grow from US\$ 118 million in 2025 to US\$ 182 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Methyl rosmarinic acid is a phenolic acid compound extracted from the rosemary plant. Belonging to the ester class of compounds, it possesses various biological activities, including antioxidant, anti-inflammatory, and antibacterial properties. As a methyl ester derivative of rosmarinic acid, it is widely used in the food, cosmetic, and pharmaceutical industries, commonly serving as a natural antioxidant and preservative. It effectively extends product shelf life and enhances the moisturizing and anti-inflammatory effects of skincare products. Furthermore, methyl rosmarinic acid has shown potential neuroprotective and anticancer effects in research.

The methyl rosmarinic acid industry chain mainly consists of raw material cultivation, active ingredient extraction, esterification modification, downstream application companies, and end markets. Upstream, it relies on the cultivation and harvesting of plants such as rosemary; the quality of raw materials directly affects the yield of active ingredients. Midstream, methyl rosmarinic acid is prepared through rosmarinic acid extraction and esterification modification processes. The core technology lies in high purity, stability, and solubility control; midstream companies typically have a gross profit margin of 25%-40%. Downstream includes companies in cosmetics, food preservatives, pharmaceuticals, and functional health products, using methyl rosmarinic acid for antioxidant purposes, shelf-life extension, and formula optimization. End products cover the skincare, cosmetics, functional foods, and natural health product markets. The overall industry chain is characterized by strong dependence on raw materials, high requirements for extraction and modification technologies, and diversified downstream applications.

In 2024, global methyl rosmarinic acid production reached 431 grams, with an average selling price of US\$267 per milligram.

Methyl rosmarinate, an esterified derivative of rosmarinic acid, combines natural origin with excellent stability, and has gained increasing attention in recent years in cosmetic antioxidant systems, food preservation formulations, and pharmacological research. Compared to rosmarinic acid itself, it exhibits better solubility and system compatibility in lipid-soluble media, thus demonstrating significant advantages in oil antioxidant properties, formulation extensibility, and ingredient permeability. Furthermore, its natural and renewable origin, aligning with clean label trends, gives it significant growth potential in functional plant extracts, green preservative alternatives, and high-end personal care products. With the continued growth in demand for natural antioxidants and cosmetic regulations trending towards safer and milder ingredients, the market application of methyl rosmarinate is expected to maintain steady expansion.
