The global Methylamine Hydrochloride market size is predicted to grow from US\$ 438 million in 2025 to US\$ 637 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Methylamine Hydrochloride is a white crystalline organic chemical salt formed by reacting methylamine gas with hydrochloric acid, widely used as an intermediate in pharmaceuticals, agrochemicals, dyes, rubber chemicals, water treatment chemicals, and specialty organic synthesis. It is valued for its stable solid form, easier storage and transportation compared with gaseous methylamine, and high reactivity in methylation and amination reactions. The supply chain begins with upstream raw materials such as methanol, ammonia, hydrogen, and chlorine-based chemicals. Methanol and ammonia are converted into methylamine through catalytic vapor-phase reactions, after which methylamine is neutralized with hydrochloric acid to produce methylamine hydrochloride crystals. Midstream activities include purification, crystallization, drying, packaging, and distribution by specialty chemical manufacturers and fine chemical suppliers. The downstream supply chain serves pharmaceutical companies producing APIs and intermediates, agrochemical manufacturers synthesizing pesticides and herbicides, chemical laboratories, electronic chemical producers, and specialty material manufacturers. Major production regions include China, India, Europe, Japan, and the United States, where manufacturers benefit from integrated amine chemistry production systems and established fine chemical supply networks. In 2025, global Methylamine Hydrochloride output was about 320,000 tons with 360,000 tons of capacity, average prices of USD 1,200-2,200 per ton, and gross margins around 21%.

United States market for Methylamine Hydrochloride is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
