Magnesium oxide (MgO) single crystal substrates are widely used in many thin film technology fields. Such as for the production of magnetic film, semiconductor film, optical film and high temperature superconducting film. MgO single crystal is one of the most important high-temperature superconducting thin film single crystal substrates for commercialization because of its low dielectric constant and loss in the microwave band and its ability to obtain large area substrates (2' and larger in diameter). It can be used to make high temperature superconducting microwave filter and other devices needed for mobile communication equipment.
