The mica group of sheet silicate minerals includes several closely related minerals with nearly perfect crystal structure. It is basically a mineral name for a group of minerals that are physically and chemically similar. It is stable upon exposure to electricity, light, moisture, and extreme temperature.

It acts as a filler & extender, provides smooth consistency, improved workability of the compound, and provides resistance to cracking. Furthermore, mica is used in paint industry as a pigment extender to facilitate suspension, prevent shrinkage, reduce chalking, and increase the resistance of the paint film.
