The global Micro Bubble Exhaust Valves market size is predicted to grow from US$ 910 million in 2025 to US$ 1325 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

Micro Bubble Exhaust Valve is a device specially designed to effectively remove tiny bubbles and free gases from the fluid system. Its core working principle relies on the spiral mesh structure inside it. The spiral mesh is welded by copper wire to form a three-dimensional mesh structure. The main function of this design is to enable the fluid to produce a relatively static area when flowing in the valve, thereby providing sufficient time and space for the separation of bubbles. When the fluid flows through the microbubble exhaust valve, the flow rate decreases, and the tiny bubbles can gradually detach from the fluid under the action of the spiral mesh and gather in the air chamber inside the valve body. The gas in the air chamber is then released to the outside through the automatic air release valve to ensure that the bubbles in the system are effectively removed. Due to the particularity of the spiral mesh structure design, it has very small pressure loss on the fluid, does not significantly hinder the flow of the fluid, and can maintain the efficient operation of the system.

In addition, a valve is designed on the side of the valve body of the microbubble exhaust valve to remove suspended impurities in the fluid, further improving the cleanliness and operation stability of the system. Through these functions, the micro-bubble exhaust valve can not only effectively remove bubbles in the system and prevent cavitation and flow instability caused by gas accumulation, but also reduce the damage of pollutants to equipment. It is widely used in water supply, industrial pump systems, boiler steam systems and other fields.
