The global Micro-Etching Liquid Copper Recovery System market size is predicted to grow from US$ 354 million in 2025 to US$ 433 million in 2031; it is expected to grow at a CAGR of 3.4% from 2025 to 2031.

The micro-etching liquid copper recovery system is an environmentally friendly industrial equipment specially used to recover copper from micro-etching liquid. Micro-etching liquid is mainly used in the manufacturing process of printed circuit boards (PCBs) and semiconductors to perform micro-etching on the copper surface, and high-concentration copper ion waste liquid will be produced after use. The system extracts copper ions in the micro-etching liquid into pure copper or copper compounds through processes such as electrolysis, precipitation, and membrane separation, while retaining or regenerating the effective ingredients in the etching liquid. This type of system not only reduces the discharge of waste liquid and resource waste, but also reduces production costs. It is an important technical means to achieve green manufacturing and circular economy.
