Micro gravure coating machine is a device that uses the micro gravure coating process to coat the surface of the substrate. Micro gravure coating is a gravure roll engraved with patterns or cells to provide a specific coating volume. It is used in a reverse kiss coating method in which the roll is partially submerged in a pan of solution. The roll rotates in the opposite direction of the web, and the cells pick up the coating solution. The flexible doctor blade lightly smoothes off the excess and the precisely measured solution in the cells is then transferred to the web. It is used to coat a variety of products, for imaging, electronics, packaging, coated thin film batteries, and other specialty applications.
