Liquefied natural gas (LNG) is natural gas in its liquid form. When natural gas is cooled to  $-162^{\circ}\text{C}$  (or  $-259^{\circ}\text{F}$ ) through a process known as liquefaction, it transforms into a clear, odorless liquid. This liquid takes up 600 times less space than natural gas, thus offering ease in terms of storage and transport. However, small- and micro-scale LNG are gradually emerging as solutions to provide small volumes of gas to demand points that are located far away from supply infrastructure. Mini/micro LNG facilities currently consist of LNG liquefaction plants supplying LNG satellite stations with annual LNG volumes of up to 0.2 MTPA. As an indication, these LNG quantities correspond to the yearly LNG demand for a power plant of up to 100 MW approximately.
