The global Micro Piezoelectric Pump market size is predicted to grow from US\$ 134 million in 2025 to US\$ 177 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

The micro piezoelectric pump is a new type of micro pump that uses the inverse piezoelectric effect of piezoelectric ceramics to achieve fluid drive. It does not require a traditional motor drive, but applies voltage to the piezoelectric ceramic to cause it to deform slightly, thereby driving the fluid through the pump chamber. The micro piezoelectric pump consists of a piezoelectric vibrator, a pump valve and a pump body. When AC power is applied to both ends of the piezoelectric vibrator, the piezoelectric vibrator compresses or elongates radially under the action of the electric field, causing the volume of the pump cavity to change, thereby realizing fluid transportation and is suitable for occasions requiring high-precision control.
