A micro-server is a small form-factor system on a chip (SoC) server. It is tailor made towards its tasks that require relatively limited compute power to carry out individually, but which need to be performed in very significant numbers.

Servers have been the most important general purpose workhorses for the datacenters designed to perform all tasks for organizations of any shape and size. Micro server is a server which is stripped down as much as possible. Now a day some businesses want machines which are specially designed to perform some specific tasks. As micro server is super-efficient at one particular task so it is used in business not as a replacement of large servers but as a supporting server along with those, because it is wastage of power as well as time to ask large servers to do small task . Micro servers are becoming

more popular as they help in saving companies space, they are more efficient servers than the traditional big servers in terms of data usage as well as money.
