The global Micro Very Small Aperture Terminal (VSAT) market size is predicted to grow from US\$ 601 million in 2025 to US\$ 1457 million in 2032; it is expected to grow at a CAGR of 13.7% from 2026 to 2032.

VSATs are typically defined as a full duplex satellite ground station with a parabolic antenna that is smaller than three meters in diameter. The Micro-VSAT is typically a terminal incorporating an antenna that has the equivalent parabolic size of less than 60cm. Micro-VSAT terminals are often called "disadvantaged terminals." This is because small terminals are limited in data throughput, due to the effective isotropic radiated power (EIRP) limitations at a system level and due to EIRP spectral density limitations defined by the various standards for operational use over the satellite. These limitations become more severe if the terminal does not meet the sidelobe requirements of the satellite operator. The reason for these imposed limitations is clear, it is important not to illuminate adjacent satellites and interfere with other users.

The Telemedicine system is made up of an interface between hardware, software, and a communication channel that eventually connects two geographical locations in order to exchange information and enable tele consultancy. Telehealth can assist rural providers in providing better health care by connecting rural providers and their patients to services at remote locations and promoting patient-centred health care. Telehealth links rural providers and their patients to services at a remote location.

Telecommunications technologies are an important part of the telemedicine process. For connectivity, various terrestrial and satellite communication media are used. One of the most important components of telemedicine is video conference, which allows for real-time interaction between participants. The quality of a video conference is determined by several factors, out of which the type of connectivity and bandwidth

attributes to successful outcome. Video conferencing is an interactive synchronous visual communication process. Video conferencing is similar to a phone call, except that the other end has a video picture as well as audio.
