Abstracts

The global Microbial Colony Screening System market size is predicted to grow from US$ 87.12 million in 2025 to US$ 118 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

A microbial colony screening system is a comprehensive platform that integrates automated equipment, image recognition technology, and data analysis software. It can automatically image, count, analyze, and identify the characteristics of microbial colonies on culture media. It then efficiently screens and isolates target colonies based on pre-set criteria (such as size, color, shape, and fluorescent markers). This system is widely used in fields such as biomedicine, food testing, environmental monitoring, and microbial breeding. It significantly improves the efficiency, accuracy, and reproducibility of traditional manual screening and is a key tool for modern high-throughput microbial research.The upstream industries of the microbial colony screening system mainly include precision optical components (such as high-resolution cameras and lenses), automated mechanical parts (such as robotic arms and stages), culture media and fluorescent labeling reagents, image processing chips and artificial intelligence algorithm suppliers. Their core technologies and material properties directly determine the imaging accuracy and intelligence level of the system; the midstream is system integrators and equipment manufacturers, responsible for software and hardware integration, image recognition algorithm development and productization; the downstream is widely used in pharmaceutical research and development, biotechnology, food safety testing, disease control centers, environmental monitoring and agricultural microorganisms. With the development of high-throughput screening and synthetic biology, the downstream demand for automated and intelligent colony analysis continues to grow, driving the industry chain to upgrade towards higher precision, faster speed and stronger data analysis capabilities.In 2024, the global
