The microbial filtration system is used for microbial inspection or other solution filtration. It mainly consists of a filtration device (filter bracket, filter cup) combined with an external vacuum pump. When this system is in use, the filter membrane is placed on the filter head and fixed and sealed with the filter cup to form a complete filtration device. Based on the principle of membrane filtration, the sample solution is separated from microorganisms (or required particulate matter), and the microorganisms or particulate matter are retained on the filter membrane and transferred to the filter membrane.

The global Microbial Filtration Detection System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
