The global Microcarbon Ferrochrome Powder market size is predicted to grow from US\$ 276 million in 2025 to US\$ 362 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

Ferrochrome powder is an iron alloy mainly composed of chromium and iron. It is one of the main alloying agents used in the steel industry, containing impurities such as carbon, silicon, sulfur, and phosphorus in addition to the main components chromium and iron. Chromium iron contains 55% to 75% chromium, and is divided into high carbon (4% to 10% C), medium carbon (0.5% to 4% C), low carbon (>0.15% to 0.5% C), and micro carbon (? 0.15% C) chromium iron according to their carbon content. High carbon ferrochrome, also known as carbon ferrochrome, and medium, low, and micro carbon ferrochrome, also known as refined ferrochrome. The lower the carbon content of ferrochrome, the more difficult it is to refine, the higher the power consumption, and the higher the cost. Chromium iron with a carbon content of less than 2% is suitable for refining stainless steel, acid resistant steel, and various other low-carbon chromium steels. Chromium iron with a carbon content of over 4%, commonly used for refining ball bearing steel and steel for automotive parts. Chromium iron containing about 5% chromium can be used as a chromium additive for alloy to iron conversion. Micro carbon chromium iron powder is mainly used for low-carbon structural steel, chromium steel, alloy structural steel, etc. It is also in the welding material and powder metallurgy industries.
