Polyurethane elastomer (microporous polyurethane elastomer) refers to a polyurethane elastic material with special micropores. The relative density is 0.3-0.8, the tensile strength is 5-10MPa, the elongation at break is 250%-600%, the tear strength is 10-48kN/m, and the embrittlement temperature is -40-20°. The main physical properties of polyurethane microporous elastomer exceed other foam or sponge materials with the same relative density. The raw materials for making microporous elastomers are oligomer polyols, polyisocyanates, chain extenders, catalysts, foam regulators or emulsifiers, foaming agents and pigments. Reactive injection molding (RIM) is often used for continuous production.
